Notes: F. is the	(-)	(-)	(-)	

Notes: $\mathbb{E}_{t,i}$ is the expectation from the perspective of person i in period t; \bar{a} is a dummy variable indicating that agent i is in the top 99 percent of the normalized a distribution. Simulated sample size is large enough such that standard errors are effectively zero. Sample is restricted to households with positive income in period t. The notation "(—)" indicates that standard errors are close to zero, given the very large simulated sample size.

Table 5: Aggregate Consumption Dynamics in SOE Model $\Delta \log \mathbf{C}_{t+1} = \varsigma + \chi \Delta \log \mathbf{C}_t + \eta \mathbb{E}_t [\Delta \log \mathbf{Y}_{t+1}] + \alpha A_t + \epsilon_{t+1}$

Notes: Reported statistics are the average values for 100 samples of 200 simulated quarters each. Bullets indicate that the average sample coefficient divided by average sample standard error is outside of the inner 90%, 95%, and 99% of the standard normal distribution. Instruments $\mathbf{Z}_t = \{\Delta \log \mathbf{C}_{t-2}, \Delta \log \mathbf{C}_{t-3}, \Delta \log \mathbf{Y}_{t-2}, \Delta \log \mathbf{Y}_{t-2}, \Delta \log \mathbf{Y}_{t-2}, \Delta_{t-3}, \Delta_{t-2}, \Delta_{t-3}, \Delta_{t-2}, \Delta_{t-3}, \Delta_{t-2}, \Delta_{t-2}, \Delta_{t-3}, \Delta_{t-2}, \Delta_{t-2$
